DETAILED ACTION

Response to Amendment

1. Receipt of applicant's amendment filed 11/07/2005 is acknowledged.

Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.
- 3. Claims 7, 9, 11, 12, and 19 are rejected under 35 U.S.C. 102(b) as being anticipated by U.S. Patent No. 4,790,743 to Leikert et al. ("Leikert")

Leikert discloses in Figures 1-3 a method of burning nitrogen containing fuel while reducing the emission of nitrogen oxides as described by applicant's claims 7, 9, 11, 12, and 19. In particular, Leikert shows producing a fuel-rich (i.e. sub-stoichiometric) primary flame core (zones 7 and 8) from all of the fuel supplied to core and primary air and adding a nitrogen oxide reducing agent (via nozzles 4) wherein the agent may consist of coal dust (i.e. a hydrocarbon fuel and thus a hydrocarbon as claimed) (see col. 2, lines 44-56). Leikert further discloses that the flame core is enveloped with a veil of secondary air (see col. 3, lines 44-60) and the nitrogen reducing agent is introduced together with both primary/core air and with fuel (see col. 3, lines 14-35).

Application/Control Number: 09/856,342 Page 3

Art Unit: 3749

In regard to the limitation that the reducing agent is distributed within the flame core, the examiner considers this limitation met by Leikert. The examiner considers that flame zones (7 and 8) of Leikert taken together are properly considered the flame core recited in applicant's claims. Leikert describes the secondary zone (8) as being "in the vicinity and around the primary flame zone" (see col. 3, lines 34-35). As shown in Fig. 1, the reducing agent supplied via nozzles (4) is clearly distributed within the flame core formed from flame zones (7 and 8). The reduction fuel is described as being uniformly distributed over the cross-section of the combustion chamber (see col. 3, lines 55-60)

Claim Rejections - 35 USC § 103

- 4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 5. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

6. Claims 8 and 18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Leikert as applied to claims 7 and 9 above and further in view of U.S. Patent No. 5,411,394 to Beer et al. ("Beer").

Leikert discloses all the limitations of claims 8 and 9 except possibly a specific recitation of the flame temperature being greater than 1100 °C or a veil of tertiary air around the flame core.

In regard to claim 8, Beer teaches a method of burning nitrogen containing fuel in the same field of endeavor as Leikert wherein the method of Beer acknowledges that low NOx burners using gaseous fuel, coal or fuel oil and forming a fuel-rich flame core having a flame core temperature of 1700 K (approximately 1450 °C or greater). Therefore, it would have been obvious to a person of ordinary skill in the art at the time the invention was made that the temperature of the flame core of Leikert would be greater than 1100 °C or greater as taught by Beer et al. as such a temperature range is well known in the art as being desirable for low NOx methods of burning (see Beer, col. 3, lines 34-67)

In regard to claim 18, Beer teaches a method of burning nitrogen containing fuel in the same field of endeavor as Leikert wherein the method of Beer includes a veil of tertiary air enveloping the flame core (see col. 8, lines 21-31 and Fig. 2b). Therefore in regard to claim 10, it would have been obvious to a person of ordinary skill in the art at the time the invention was made to modify the method of Leikert to incorporate the tertiary air veil of Beer as the use of a tertiary air veil is particularly preferred in further assisting in the reduction of NOx production (see col. 8, lines 14-31).

7. Alternatively, claims 7 and 17 are rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Patent No. 4,790,743 to Leikert et al. ("Leikert") in view of U.S. Patent No. 4,739,713 to Vier et al. ("Vier").

Leikert discloses in Figures 1-3 a method of burning nitrogen containing fuel while reducing the emission of nitrogen oxides substantially as described by applicant's claims 7 and 17. In particular, Leikert shows producing a fuel-rich (i.e. sub-stoichiometric) primary flame core from all of the fuel supplied to core and primary air and adding a nitrogen oxide reducing agent wherein the agent may consist of coal dust (see col. 2, lines 44-56). Leikert further discloses that the flame core is enveloped with a veil of secondary air (see col. 3, lines 44-60) and the nitrogen reducing agent is introduced together with both primary/core air and with fuel (see col. 3, lines 14-35).

In regard to the limitation that the reducing agent is nitrogen, the examiner notes that the title of the Leikert patent is "Method of reducing the NOx-emissions during combustion of *nitrogen-containing fuels*" (emphasis added). The fuel that is being utilized in Leikert is coal dust thus implying that coal dust contains nitrogen and thus the coal dust supplied as a nitrogen oxide reducing agent would qualify as a nitrogen compound as claimed. In further support of this observation, the Vier reference is cited. Vier teaches a coal-dust fired combustion system in the same field of endeavor as Leikert, wherein Vier specifically discloses the coal dust is known in the art to include nitrogen which is termed "in-fuel" nitrogen (see Vier col. 1, lines 41-45). A person of ordinary skill in the art would therefore recognize that the coal dust of

Leikert, which is acknowledged to function as a nitrogen oxide reducing agent (see col. 2, lines 44-53), would include nitrogen and is, therefore, a nitrogen compound as claimed.

Further, in regard to the limitation that the nitrogen compound is natural gas or methane, Leikert discloses that the reduction agent may be a "burnable gas" (see col. 2, lines 54-55). The examiner considers that a person of ordinary skill in the art would reasonably consider the selection of a well-known combustible gas such as natural gas or methane as the "burnable gas" to function as the reduction fuel. Alternatively, reference is also made to Vier to support this assertion. In Vier, natural gas is identified as the reducing agent (see Vier, col. 3, lines 37-38). It would have been obvious to a person of ordinary skill in the art at the time the invention as made that the burnable gas of Leikert would be natural gas as identified in Vier as natural gas is well known to desirably serve as a reducing gas in the combustion art.

8. Claim 16 is rejected under 35 U.S.C. 103(a) as being unpatentable over Leikert in view of Vier et al. as applied to claim 7 above, and further in view of U.S. Patent No. 5,809,910 to Svendssen ("Svendssen").

Leikert in view of Vier teach all the limitations of claim 16 except that the nitrogen compound is either ammonia, ammonia water, or urea.

Svendssen teaches a method of burning a fuel and reducing NOx production that is analogous to Leikert. In Svendssen, a reducing agent such as ammonia or urea is added to the fuel (see col. 3, lines 59-67).

Therefore, in regard to claim 16, it would have been obvious to a person of ordinary skill in the art at the time the invention was made to modify the reduction agent of Leikert to be urea

Art Unit: 3749

or ammonia as taught by Svendssen as these chemicals are recognized in the art as suitable to bring about a desired reduction in NOx production when they added to a fuel for combustion (see Svendssen, col. 3, lines 59-67).

Response to Arguments

9. Applicant's arguments filed 11/07/2005 have been fully considered but are not persuasive.

Regarding Leikert taken alone

Applicant appears to primarily reiterate arguments that were presented in the response of 1/24/2005. Applicant again argues that the flame zones (7 and 8) of Leikert are not properly considered to be the flame core recited as recited. The examiner again notes that it is well settled that during patent examination claims are to be given their broadest reasonable interpretation consistent with the underlying specification without reading limitations from the specification into the claims. In re Prater, 415 F.2d 1393, 1404-05, 162 USPQ 541, 550-51 (CCPA 1969). With this in mind, the examiner maintains his position that, in giving the term "flame core" its broadest reasonable interpretation, the limitation reads on the arrangement of the flame zones (7 and 8) in Leikert. Stated in a different manner, the term "flame core" does not prohibit a "core" having multiple zones.

To further support the assertion that the flames zones (7 and 8) of Leikert are properly considered a flame core, the examiner notes that Leikert describes the range of the air to fuel ratio of the primary flame zone (7) as 0.65 to 0.9 (Leikert, col. 2, lines 61-62) and the range of the air to fuel ratio of the secondary flame zone (8) as 0.5 to 0.8 (Leikert, col. 2, line 63).

Art Unit: 3749

Therefore, even if arguendo one were to assume that the "flame core" recited in applicant's claims required a uniform air to fuel ratio, this definition would also be met by the flame zones (7 and 8) of Leikert. Such a conclusion is reached because the air to fuel ratios contemplated for these flame zones include overlapping ranges (i.e. 0.65 to 0.8).

Further, applicant appears to admit that should flame zones (7 and 8) of Leikert have the same air to fuel ratio then there would be no demarcation between these zones (see the paragraph spanning pages 3 and 4 of applicant's 11/07/2005 response). As noted above, this is precisely the result that would occur when the flame zones (7 and 8) each have an air to fuel ratio within the overlapping ranges (0.65 to 0.8) expressly provided in Leikert (again see col. 2, lines 63-65). This disclosure clearly contradicts applicant's summary statement that Leikert unambiguously discloses that flames zones (7 and 8) are "separate and different."

Regarding Leikert in view of Vier

In further support of the examiner's assertion that flame zones (7 and 8) of Leikert may properly be considered the "flame core" recited in applicant's claims, the examiner points to the use of the term "core" as appearing in Vier. Vier identifies in multiple locations a burner core (55). This burner core is considered analogous to applicant's recited flame core. Vier specifically notes that such a burner core has multiple "zones" (e.g. see col. 2, lines 9-10, and col. 5, lines 2, 11, and 67). Accordingly, the examiner considers that a person of ordinary skill in the art would recognize that the use of the term "core" in the art includes multiple "zones" (such as 7 and 8 of Leikert) as the definition of such terminology is recognized in the art as evidenced by Vier.

Application/Control Number: 09/856,342

Art Unit: 3749

Applicant further argues that the teachings of Vier would not prompt a person of ordinary skill in the art to cause a reducing agent to be introduced into the primary flame zone (7) of Leikert. However, Vier has not relied upon by the examiner for such a showing. As noted above, Vier is relied upon to show that a person of ordinary skill in the art would recognize that the coal dust used as the reducing agent in Leikert would include nitrogen and as evidence that a natural gas would be a type of burnable gas identified in Leikert.

Response to applicant's remaining arguments

The bulk of applicant's remaining arguments are premised on the assertion that the examiner is proposing modifying Leikert to supply a reducing agent to flame zone (7). However, the examiner notes that this not an accurate characterization of the examiner's position. As thoroughly articulated previously, and again above, applicant's flame core is not distinguished from flame zones (7 and 8) of Leikert. Therefore, applicant's claims are fully met by the disclosure of adding reduction fuel from nozzles (4) to the flame core via flame zone (8).

Conclusion

Accordingly, applicant's claims are not considered to read over the prior art of record.

10. THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37

Application/Control Number: 09/856,342

Art Unit: 3749

CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event,

however, will the statutory period for reply expire later than SIX MONTHS from the mailing

Page 10

date of this final action.

11. Any inquiry concerning this communication or earlier communications from the

examiner should be directed to Examiner Josiah Cocks whose telephone number is

(571) 272-4874. The examiner can normally be reached on weekdays from 8:00 AM

to 5:30 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's

supervisor, Ehud Gartenberg, can be reached at (571) 272-4828. The fax phone number for the

organization where this application or proceeding is assigned is (571) 273-8300.

Information regarding the status of an application may be obtained from the Patent

Application Information Retrieval (PAIR) system. Status information for published applications

may be obtained from either Private PAIR or Public PAIR. Status information for unpublished

applications is available through Private PAIR only. For more information about the PAIR

system, see http://portal.uspto.gov/external/portal/pair. Any questions on access to the Private

PAIR system should be directed to the Electronic Business Center (EBC) at (866) 217-9197

(toll-free).
